CRUD Login and Registration

Implement a user authentication system with login and registration functionality, along with full CRUD (Create, Read, Update, Delete) operations for managing user data.

1. Apply a themed design for the login and registration pages.
2. Ensure users register before logging in, with their data securely stored in the database.
3. Implement login functionality that verifies the user's email and password against the database.
4. Upon successful login, display all user information (name, email, password).
5. Enable users to update or delete their information as needed.
